Useful methods for solving part 1

Selenium webdriver possesses multiple default methods, some of them are useful for solving the tasks given by Itera. These methods are usually used for validation purposes. You are free to use any other methods found besides these, as long as it validates the results from the tests correctly.

[WebElement].getText()	Returns innerText of a WebElement. Example: target a text on the website using driver.findBy() or @FindBy, then call .getText() on the WebElement to return the string of the targeted text.
[ChromeDriver].getCurrentUrl()	Returns the URL on the current side

These methods may be used in conjunction with JUnit's assertion methods to validate if a specific objective has been achieved
